The invention relates to a novel isolated 17 mer nucleic acid sequence, cgiven in the specification, a sequence containing at least 15 consecutive given in the specification, a sequence with, after Optimal andless to mucleotides from the 17 mer sequence, a sequence that alignment, at least 80 % identify to the 17 mer sequence, a sequence that optimizes to them under highly stringent conditions, or the complement of any of them, or the corresponding RNA. The novel isolated mucleic caids of the invention are useful as probes and primers for detecting, identifying and/or amplifying a nucleic acid, e.g. as one component of a gene chip, in vitro as (anti) sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, corrector or antibodies directed against the polypeptides are useful for vector or antibodies directed against the polypeptides are useful for cy preparation of pharmaceuticals for prevention and/or treatment of viral ciseases that are characterised by development of tumours or cell diseases that are characterised by development of tumours or cell corrections. Analysis of the expression of the 17 mer nucleic acids in patient samples is useful for disposis and/or prognosis of these companients. The nucleic acid sequences of the invention can be used in gene therapy. This polymucleotide sequence represents a tumour suppression crelated human fukutin oligonucleotide of the invention
                                                                                                                                                                                                                                                                        Cytostatic; virucide; neuroprotective; nootropic; neuroleptic; gene chip; antisense; sense; tumour; cell degeneration; cancer; Alzheimer's disease; schizophrenia; protein chip; gene therapy; tumour suppression; human fukutin; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          isolated nucleic acid, useful for treating viral diseases associated tumors and cell degeneration, also related polypeptides, antibodies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MD23, MD24, MD27, MD212. MD23 is encoded at chromosome 7q22.1, MD24 is encoded at chromosome 6p21.3-22.2, MD27 is encoded at chromosome 16p11.2 and MD212 is encoded at chromosome 15q26.1. The MD23, MD24, MD27, and MD212 sequences are useful in therapy, or in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MD23, MD24, MD27, or MD212, e.g. cancer or developmental disorders. The nucleic caused by altered expression of MD23, MD24, MD27, or MD212. The nucleic acids and proteins are also useful for diagnosing or monitoring a disease caused by altered expression of MD23, MD24, MD27, or MD212. The nucleic acids can also be used as probes to detect and characterize gross alterations in MD23, MD24, MD27, or MD212 genetic locus. The probes are useful in constructing microaarrays for measuring gene expression. The proteins are useful as therapeutic agents for gene therapy or as proteins. The present sequence was used to illustrate the invention.
                                                                                                                                                                                     Cytostatic; immunostimulant; gene therapy; vaccine; human;

The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MDZ3, MDZ4, MDZ1, MDZ12. MDZ3 is proteins and their coding sequences: MDZ3, MDZ4, MDZ7, MDZ12. MDZ3 is cancoded at chromosome 6p21.3-22.2, MDZ7 is encoded at chromosome 6p21.3-22.2, MDZ7 is encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome 16p12. and MDZ12 is encoded at chromosome 16p12. and MDZ12 is encoded at chromosome 16p13. MDZ4, MDZ7, MDZ4, MDZ7, and MDZ12 sequences are useful in therapy, or in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3, MDZ4, MDZ1, or MDZ12, e.g. cancer or developmental disorders. The nucleic acids and proteins are also useful for diagnosing or monitoring a disease acids can also be used as probes to detect and characterize gross alterations in MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic acids can also be used as probes to detect and characterize gross alterations in MDZ3, MDZ7, or MDZ12 genetic locus. The probes are proteins are useful as therapeutic agents for gene therapy or as proteins are useful as therapeutic agents for gene therapy or as proteins are useful as therapeutic agents for gene therapy or as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Cytostatic; immunostimulant; gene therapy; vaccine; human; zinc finger protein; MDZ3; MDZ4; MDZ12; chromosome 7q22.1; chromosome 6p21.3-22.2; chromosome 16p11.2; chromosome 15q26.1; cancer;

The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MDZ3, MDZ4, MDZ7, MDZ12. MDZ3 is proteins and their coding sequences: MDZ3, MDZ4, MDZ12. MDZ31s. MDZ4 is encoded at chromosome 6p12.3-22.2, MDZ4 is encoded at chromosome 6p11.2 and MDZ12 is encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome 16p12.3 and MDZ12 is encoded at chromosome 16p2.3 and manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3, MDZ4, MDZ1, e.g. cancer or developmental disorders. The nucleic caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic acids and slso be used as probes to detect and characterize gross alterations in MDZ3, MDZ4, MDZ7, or MDZ12 genetic locus. The probes are useful in constructing microarrays for measuring gene expression. The proteins are useful as therapeutic agents for gene therapy or as proteins are useful as therapeutic agents for gene therapy or as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Nucleic acid molecule; Hepatitis C virus; HCV; Hepatitis B virus; HBV; RNA stability; RNA expression; RNA synthesis; antisense; enzymatic nucleic acid; hammerhead ribozyme; DNAzyme; inozyme; zinzyme;
                                                                                                                                                                                                                                                                                                                                                   New zinc finger-containing proteins and nucleic acids, useful in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MD23, MD24, MD27 or MD212, e.g. cancer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ઠે
                                                                                                                                                                                                                                                                                                                                                The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes, Inozymes, zinzymes, amberzymes, and G-cleaver ribozymes. Also disclosed in en uncleic acid decoy molecules and aptamers that bind to HBV reverse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV DNA. The nucleic acids may be used to modulate the expression of HBV genes and HBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds compounds and/or potential therapies directed against HBV, and compounds and mar/or potential for the treatment of degenerative and that modulate the expression and for the treatment of degenerative and disease states related to HBV and HCV infection, replication and gene carcinoma. The present sequence represents a substrate for one of the HBV ribozyme, inozyme, G-cleaver, zinzyme, DNAzyme or amberzyme sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                      Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

```
The present invention relates to nucleic acid molecules which modulate
the synthesis, expression and/or stability of Hepatitis C virus (HCV) or
Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense
and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes,
inozymes, zinzymes, amberzymes, and G-cleaver ribozymes. Also disclosed
are nucleic acid decoy molecules and aptamers that bind to HBV reverse
transcriptase and/or HBV reverse transcriptase primer sequences, as well
as oligonucleotides that specifically bind the Enhancer I region of HBV
DNA. The nucleic acids may be used to modulate the expression of HBV
compounds and/or potential therapies directed against HBV, and compounds
that modulate the expression and/or replication of HCV. The compounds
that modulate the expression and/or replication of HCV. The compounds
char modulate the expression and/or replication of HCV. The compounds
char modulate the expression and/or replication of HCV. The compounds
char modulate the activated to HBV and HCV infection, replication and gene.

Compounds uch as cirthosis, liver failure, and hepatocellular
carcinoma. The present sequence represents a substrate for one of the HBV
carcinoma, inozyme, G-cleaver, zinzyme, DNAzyme or amberzyme sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus
Nucleic acid molecule, Hepatitis C virus, HCV, Hepatitis B virus; HBV; RNA expaliity; RNA expression; RNA synthesis; antiennse; enzymatic nucleic acid; hammerhead ribozyme; DNAzyme; inozyme; zinzyme; amberzyme; G-cleaver ribozyme; decoy molecule; aptemer; nozyme; amberzyme; deverse transcriptase; Enhancer I region; viral replication; degenerative; disease state; HBV infection; HCV infection; cirrhosis; liver failure; hepatocellular carcinoma; hepatotropic; cytostatic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to murine oligonucleotides (ACC62754-ACC68806), which are associated with tumour suppression, tumour reversion, apoptoosis and virus resistance. The oligonucleotides are useful as (1) as probes and primers for detecting, identifying, quantifying and/or amplifying nucleic acid, e.g. as one component of a gene chip; in virco as (anti) sense reagents; and (2) for production of recombinant polypeptides. The oligonucleotides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration,
                                                                                                                                                                                                                                                                                                                                                                          New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Cytostatic; virucide; neuroprotective; nootropic; neuroleptic; murine; tumour suppression; tumour reversion; apoptosis; virus resistance; viral disease; tumour; cell degeneration; cancer; Alzheimer's disease;

The present invention relates to murine oligonuclectides (ACC62754-ACC68806), which are associated with tumour suppression, tumour reversion, apoptosis and virus resistence. The oligonuclectides are useful as (1) as probes and primers for detecting, identifying, quantifying and/or amplifying nucleic acid, e.g. as one component of a gene chip; in vitro as (anti) sense reagents; and (2) for production of recombinant polypeptides. The oligonuclectides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             primer; probe; tumour suppression; tumour reversion; apoptosis; virus resistance; transgenic animals; Alzheimer's disease; schizophrenia;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

                                                                                                                                                                                               The invention relates to the isolation of 6327 nucleotide sequences, fragments of at least 15 consecutive nucleotides of these nucleotides, a sequence having at least 80% identity, after optimal alignment, with the nucleotides, a sequence that hybridizes under stringent conditions with the nucleotides, or the complement, or corresponding RNA, of the nucleotides or the nucleotides are used as probes or primers for detecting, identifying, quantifying and/or amplifying nucleic acids, as in vitro sense and antisense sequences, of nucleotides involved in tumour
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 or cell degeneration (e.g. Alzheimer's disease or schizophrenia). Analysis of the expression of the nucleotides can be used for diagnosis and/or prognosis of these diseases. The nucleotides and polypeptides can
                                                                                                                                                                                                                                                                                                                                                  suppression or reversion, apoptosis and or viral resistance, to produce recombinant polypeptides, and to prepare transgenic animals, as experimental models. The nucleotides (also vectors containing them and cells containing the vectors), the encoded polypeptides and antibodies (Ab) against the polypeptide are useful for prevention and/or treatment of viral infections or diseases characterized by development of tumours
                                                                               New nucleic acid encoding human prostate membrane-specific antigen, useful e.g. for treatment of tumors and viral infection, also related polypeptide and antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

                                                                                                       The present invention describes the human anglomotin-like protein 1 (AMLP1). human AMLP1 has cytostatic activity, and can be used in gene therapy. The AMLP1 protein, nucleic acid molecules, antibodies, and compositions of the present invention can be used for treating or preventing a disorder associated with decreased or increased expression or activity of AMLP1. The present sequence represents a scanning oligonucleotide for human AMLP1b, which is used in an example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes the human angiomotin-like protein 1 (AMLP1). human AMLP1 has cytostatic activity, and can be used in gene therapy. The AMLP1 protein, nucleic acid molecules, antibodies, and compositions of the present invention can be used for treating or preventing a disorder associated with decreased or increased expression or activity of AMLP1. The present sequence represents a scanning oligonucleotide for human AMLP1b, which is used in an example from the
New isolated nucleic acid molecule encoding a human angiomotin-like protein, useful for treating or preventing a disorder associated with decreased or increased expression or activity of AMLP1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New isolated nucleic acid molecule encoding a human angiomotin-like protein, useful for treating or preventing a disorder associated with decreased or increased expression or activity of AMLP1.

The AMLP1 protein, nucleic acid molecules, antibodies, and compositions of the present invention can be used for treating or preventing a disorder associated with decreased or increased expression or activity of AMLP1. The present sequence represents a scanning oligonucleotide for human AMLP1b, which is used in an example from the
                                                                                                                                                                                                                                                                                                                                                                                New isolated nucleic acid molecule encoding a human angiomotin-like protein, useful for treating or preventing a disorder associated with decreased or increased expression or activity of AMLP1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

fragments of at least 15 consecutive nucleotides of these nucleotides, a fragments of at least 15 consecutive nucleotides of these nucleotides, a sequence having at least 8% identity, after optimal alignment, with the nucleotides, a sequence that hybridizes under stringent conditions with the nucleotides, or the complement, or corresponding RNA, of the nucleotides. The nucleotides are used as probes or primers for detecting, identifying, quantifying and/or amplifying nucleic acids, as in vitro sense and antisense sequences, of nucleotides involved in tumour suppression or reversion, apoptosis and or viral resistance, to produce recombinant polypeptides, and to prepare transgenic animals, as recombined models. The nucleotides (also vectors containing them and cells containing the vectors), the encoded polypeptides and antibodies (Ab) against the polypeptide are useful for prevention and/or treatment of viral infections or diseases characterized by development of tumours or cell degeneration (e.g. Alzhehamer's disease can be used for disponsis any siss of the expression of the nucleotides can be used for disponsis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            cytostatic; virucide; neuroprotective; nootropic; neuroleptic; probe; primer; PCR; gene chip; antisense; viral disease; tumour; cell degeneration; cancer; Alzheimer's disease; schizophrenia; ds; human.
primer; PCR; gene chip; antisense; viral disease; tumour; cell degeneration; cancer; Alzheimer's disease; schizophrenia; ds; human.
                                                                                                                                                                                                                                                                                                                                in the phenomena of tumour suppression, tumour reversion, apoptosis and/or resistence to viruses. The invention may be useful for the and/or resistence to viruses. The invention may be useful for the nootropic or neuroleptic activity. The DNA sequences may be useful as probes and primers for detecting, indentifying, quantifying and/or amplifying nucleic acid, for example as one component of a gene chip, in vitro as antisense reagents and for production of recombinant polypeptides. The invention may therefore be useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia. The present sequence is that of a nucleic acid sequence of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                          New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells.
                                                                                                                                                                                                                                                                                                                     This invention relates to novel isolated nucleic acid sequences involved

in the phenomena of tumour suppression, tumour reversion, apoptosis and/or resistance to viruses. The invention may be useful for the development of compounds with a cytostatic, virucide, neuroprotective, nootropic or neuroleptic activity. The DNA sequences may be useful as probes and primers for detecting, indentifying, quantifying and/or amplifying nucleic acid, for example as one component of a gene chip, in vitro as antisense reagents and for production of recombinant vitro as antisense reagents and for production of recombinant pharmaceuticals for prevention may therefore be useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia. The present sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                             New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention relates to novel isolated nucleic acid sequences involved

                                                                                                                                  셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a composition which contains at least one vector (B) containing a nucleic acid (I) associated with breast cancer. The vector (B), also polypeptides (II) encoded by (I), are used for treatment of breast cancer. Arrays based on (I), (II), or their fragments, and (II)-specific antibodies (Ab) are used to predict characteristics (e.g. invasiveness or stage) of breast cancer, and (I), or its fragments, are used to modulate characteristics of such cells, to identify breast cancer genes and to detect breast cancer (by detecting polymorphic nucleic acid or its products). The present sequence represents a human ER+ breast cancer differentially expressed sequence.
                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                 The
                                    New nucleic acid sequences associated with tumor suppression, regression, apoptosis or virus resistance are useful to diagnose and treat viral disease, development of tumor cells and cell degeneration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Vector containing nucleic acid associated with breast cancer, useful for treating, diagnosing and characterizing breast cancer, also related polypeptides and antibodies.
                                                                                                                                                                                 with tumour suppression or regression, apoptosis or virus resistance. invention relates to these sequences or sequences having at least 80% identity to them, and polypeptides encoded by the sequences or polypeptides having 80% identity to the polypeptide sequences. The invention is used to diagnose or treat viral disease or disease characterized by development of tumour cells or cellular degeneration
                                                                                                                                                                represents an isolated nucleic acid sequence associated
                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human ER+ breast cancer differentially expressed sequence #482.

The invention relates to an enzymatic nucleic acid molecule that specifically cleaves RNA derived from hepatitis B virus (HBV) and comprising one or more binding arms, without requiring the presence of a useful for treating hepatitis B virus infection, hepatitis, hepatocellular carcinoma, cirrhosis and liver failure, either alone or in combination with other therapies such as lamivadine and interferons. The nucleic acids are useful as diagnostic tools to examine genetic drift and mutations within diseased cells, for detecting the presence of HBV RNA in a cell, for the study of RNA and for down-regulating gene expression of target genes in bacterial, fungal, viral, plant or mammalian cells. This sequence repersents an HBV RNA target sequence, used in the scope of the invention. Note: The sequence data for this patent is also available in electronic format from USPTO at seqdata.uspto.gov/sequence.html.
                                                                                                                                                                                                          Novel enzymatic nucleic acid molecule such as DNAzymes and inozymes specifically cleaving RNA derived from hepatitis B virus and comprising one or more binding arms, useful for treating hepatitis and cirrhosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 17 BP; 4 A; 3 C; 2 G; 0 T; 8 U; 0 Other;

The invention relates to an enzymatic nucleic acid molecule that specifically clasves RNA derived from hepatitis B virus (HBV) and comprising one or more binding arms, without requiring the presence of a 2.0H group within the molecule for activity. The nucleic acids are useful for treating hepatitis B virus infection, hepatitis, hepatocellular carcinoma, cirrhosis and liver failure, either alone or in combination with other therapies such as lamivudine and interferons. The nucleic acids are useful as diagnostic tools to examine genetic drift and mutations within diseased cells, for detecting the presence of HBV RNA in a cell, for the study of RNA and for down-regulating gene expression of target genes in bacterial, fungal, viral, plant or mammalian cells. This sequence represents an HBV RNA target sequence, used in the scope of the invention. Note: The sequence data for this patent is also available in electronic format from USPTO at seqdata.uspto.gov/sequence.html.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel enzymatic nucleic acid molecule such as DNAzymes and inozymes specifically cleaving RNA derived from hepatitis B virus and comprising one or more binding arms, useful for treating hepatitis and cirrhosis.
                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Hepatitis B virus; HBV; 88; enzymatic nucleic acid; RNA cleavage; hepatitis B virus infection; hepatitis; hepatocallular carcinoma; cirrhosis; liver failure; lamivudine; interferon; genetic drift; virucide; hepatotropic; antiinflammatory; cytostatic.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a novel polypeptide (1) comprising a sequence (31) of wyosin-like protesin-1 (hGDMLP-1) having 2568 amino acids fully defined in the specification, a fragment of at least 8 amino acids of (S1), 95% deviation from (S1) which are conservative substitutions, and 65% identity to (S1). A polypeptide of the invention acts as a agonist or antagonist of hGDMLP-1, or as an inhibitor of hGDMLP-1 activity. A pharmaceutical composition of the invention is useful for treating or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel myosin-like protein-1, useful for treating or preventing disorder associated with decreased expression or activity of human genome-derived myosin-like protein-1 such as disorder of heart and/or skeletal muscle
                                                                                                                                                                                                                   ss; probe; myosin-like protein-1; hGDMLP-1;

     The invention relates to a novel polypeptide (I) comprising a sequence (SI) of myosin-11ke protein-1 (hGDMLP-1) having 2568 amino acids fully defined in the specification, a fragment of at least 8 amino acids of (SI), 95% deviation from (SI) which are conservative substitutions, and satisfaction from (SI) hand are conservative substitutions, and antagonist to (BOMLP-1, or as an inhibitor of hGDMLP-1 activity. A pharmaceutical composition of the invention is useful for treating or preventing a disorder associated with decreased expression or activity of hGDMLP-1, such as a disorder of heart and/or skeletal muscle function. The present sequence represents a 17-mer nucleotide, used in the invention for scanning the sequence represented in ACN63103
                                                                                                                                                                                                                                                                                                                                                                                                                                Human; ss; probe; myosin-like protein-1; hGDMLP-1;
hGDMLP-1 agonist hGDMLP antagonist; hGDMLP inhibitor; heart disorder;
skeletal muscle function.

                                                                                                                                                                           The invention relates to a novel polypeptide (I) comprising a sequence (SI) of myosin-like protein-1 (hGDWLP-1) having 2568 amino acids fully defined in the specification, a fragment of at least 8 amino acids fully (SI), 95% deviation from (SI) which are conservative substitutions, and antagonist of hGDMLP-1, or as an inhibitor of hGDMLP-1 activity. A pharmaceutical composition of the invention is useful for treating or preventing a disorder associated with decreased expression or activity of preventing a disorder of heart and/or skeletal muscle function. The present sequence represents a 17-mer nucleotide, used in the invention for scanning the sequence represented in ACN63103
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                        Novel myosin-like protein-1, useful for treating or preventing disorder associated with decreased expression or activity of human genome-derived myosin-like protein-1 such as disorder of heart and/or skeletal muscle function.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; 88; probe; myosin-like protein-1; hGDMLP-1;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a novel polypeptide (I) comprising a sequence (S1) of myosin-like protein-1 (hGDMLP-1) having 2568 amino acids fully defined in the specification, a fragment of at least 8 amino acids fully (S1), 95% deviation from (S1) which are conservative substitutions, and 55% identity to (S1). A polypeptide of the invention acts as a agonist or pharmaceutical composition of the inhibitor of hGDMLP-1 activity. A pharmaceutical composition of the invention is useful for treating or preventing a disorder associated with decreased expression or activity of hGDMLP-1, such as a disorder of heart and/or skeletal muscle function. The present sequence represents a 17-mer nucleotide, used in the invention for scanning the sequence represented in ACN63102
                                                                                                                                                                                                                                                                                     Novel myosin-like protein-1, useful for treating or preventing disorder associated with decreased expression or activity of human genome-derived myosin-like protein-1 such as disorder of heart and/or skeletal muscle
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Mutant forms of genes encoding minK protein and KVLQT1 protein involved in cardiac potassium channel formation useful for screening drugs, for preventing and treating cardiac arrhythmis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                Shannon ME;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleocide sequences. AAZ7740 to AAZ7740 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haploryping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from
                                                                                                                                                                                                                                                                                                                               ö
                                                 The invention relates to KVLQT1 and KCNE1 genes, associated with long QT (LQT) syndrome. It provides a minK protein comprising a mutation which substitutes the wild type amino acids with Leu, Asp, Leu, His, Trp and Ala or Thr at residues 74,76,28,32,98 and 127 respectively. Screening KVLQT1 and KCNE1 is useful for identifying mutations for diagnosing and treating LQT. The ability to predict LQT enables physicians to prevent the diseases with medical therapy such as beta blocking agents and opts for better treatments. Sequences AAZ90707-Z90740 represent PCR primers for amplifying human KVLQT1 exons
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel biallelic markers used to construct a high density disequilibrium

AAZ69579 to AAZ7740 represent amplification primers for the biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other treatment.

N. B. The SEQ ID NOS 2852, 2913, 2974, 3035, 3157, 3227, 3297 and 3367, are not actually given a sequence in the Sequence Listing from the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to KVLQT1 nucleic acids which have a mutation of 676 amino acids which forms a cardiac I(ks) potassium channel with the KVLQT1 protein (AAY80563). The KVLQT1 gene encodes a protein of 676 amino acids which forms a cardiac I(ks) potassium channel with the KCNE1 protein (AAY80563). The KVLQT1 gene contains 15 introns and encodes a protein containing 6 putative transmembrane segments and a pore forming region. The gene has been mapped to the chromosomal location 11p15.5. The sequences AAZ89837-238970 represent primers used to PCR amplify the KVLQT1 exon sequences. Mutations in the KVLQT1 or KVRE1 genes result in cardiac arrhythmias observed as a prolonged QT curve in electrocardiograms (Long QT syndrome). The genes and proteins can be used for the diagnosis of subjects with long QT syndrome. They can also be used to screen for drugs which can be used for treating or preventing long QT syndrome. They was also be used for gene therapy,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New isolated mutant KVLQT1 nucleic acids, useful for developing products for the diagnosis, prevention and treatment of long QT syndrome.
                                                                                                                                                                                                                                                                                                                              KVLQT1; mutation; human; cardiac I(ks) potassium channel; KCNE1; ss;

```
The present invention describes a radiation hybrid map of the dog (Canine familiaris) genome comprising the genome location of a marker selected from AAA66139 to AAA66942. The radiation hybrid map is useful for identifying and localising dog genes, since it covers approximately 80 % of the dog genome and provides a dense map integrating different types (i.e. Type I and Type II) of markers. The map and the dog genome markers responsible for phenotypic and behavioural traits in dogs, to identify morbid genes, to analyse diseases and identify implicated genes in such diseases and their alleles, and to study dog pedigrees. They may also be useful for isolating corresponding human gene sequences e.g. genes involved in genetic diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; KVLQT1; antiarrhythmic; cardiant; gene therapy; PCR primer; cardiac potassium channel; Jervell and Lange-Nielsen Syndrome; JLN; chromosome 11p15.5; long QT syndrome; ss.

                                                                                                                                                                                                                                                                                                                                                                       셤
                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                               KVLQT1 is a cardiac potassium channel and mutations in the KVLQT1 gene cause Jervell and Lange-Nielsen Syndrome (JLN). KVLQT1 maps to chromosome 11p15.5. The present invention relates to a mutant KVLQT1 coding sequence (see AAC89914). The mutant KVLQT1 coding sequence is useful in the diagnosis of long QT syndrome and in screening humans for the presence of KVLQT1 gene variants which cause JLN syndrome. The present sequence is a PCR primer used to amplify a KVLQT1 exon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Neurofibromatosis type 1; NF1; peripheral blood lymphocyte; PBL; EBV; ss; Epstein-Barr virus; B-lymphoblastoid cell; phytohaemagglutinin; PHA; frame shift mutation; mis-sense mutation; silent mutation; PCR primer;
                                                                                                                                                                    DNA encoding for a mutant KVLQT1 which causes Jervell and Lange-Nielsen syndrome (JLN) when homozygous, useful for diagnosing long QT syndrome, or diagnosing or prognosing JLN.

The sequences represent neurofibromatosis type 1 (NF1) cDNA fragments and commandation analysis of the NF1 gene involves isolating extend for mutation analysis of the NF1 gene involves isolating peripheral blood lymphocytes (PBL) of a patient, establishing Epstein-CC Barr virus (EBV) transformed B-lymphoblastoid cell line with isolated Barr virus (EBV) transformed B-lymphoblastoid cell line with isolated Stimulation, treating the cell line or short-term culture with protein stimulation, treating the cell line or short-term culture with protein synthesis inhibitor and immediately extracting RNA from the cultures. The RNA is then amplified and peptide fragments are obtained by in vitro SNA is then amplified and peptide fragments. Nutation allysis of transcription/translation of amplified fragments. Nutation allysis of NF1 is used for detection of frame shift, mis-sense and silent mutations in various exons of the gene. This is useful in screening for NF1 mutations in young children who are often oligosymptomatic. Efficacy of a mutation is monitored in vitro using cell systems in which modulate nor systems of the sequences can be used to design defective NF1 gene is expressed. The sequences can be used to design drugs which modulate NF1 activity, by using knowledge of the structure of the NF1 protein and of specific defects of the various NF1 mutant the proteins. The method allows for reliable analysis of mutations that are difficult to detect due to unstable or wrong-spliced transcripts ö Neurofibromatosis type 1; NF1; peripheral blood lymphocyte; PBL; EBV; ss; Epstein-Barr virus; B-lymphoblastoid cell; phytohaemagglutinin; PHA; frame shift mutation; mis-sense mutation; silent mutation; PCR primer; Mutation analysis of NF1 gene by treating EBV transformed lymphoblastoid cell lines formed with lymphocytes of patient with protein synthesis inhibitor, and obtaining peptides by translating amplified RNA from cell Gaps ö 1.2%; Score 13.4; DB 1; Length 18; 93.3%; Pred. The sequences represent neurofibromatosis type 1 (NF1) cDNA fragments and equencing primers for use in mutation analysis of NF1. A method for mutation analysis of the NF1 gene involves isolating certod for mutation analysis of the NF1 gene involves isolating particles. Perspheral blood lymphocytes (PBL) of a patient, establishing Epstein-Epsty transformed B-lymphoblastoid cell line with isolated PBL, or short-term culturing of PBL by phytohemagglutinin (PHA) stimulation, treating the cell line or short-term culture with protein synthesis inhibitor and immediately extracting RNA from the cultures. The RNA is then amplified and peptide fragments are obtained by in vitro transcription/translation of amplified fragments. Mutation analysis of NP1 is used for detection of frame shift, mis-sense and silent mutations in voung children who are often oligosymptomatic. Efficacy of a mutations in young children who are often oligosymptomatic. Efficacy of a clug or agent can be identified by a screening process in which modulation is expressed. The sequences can be used to design drugs which modulate NF1 activity, by using knowledge of the structure of the NF1 protein and of specific defects of the various NF1 mutant cross the NF1 protein and of specific defects of the various NF1 mutant cross that are difficult to detect due to unstable or wrong-spliced transcripts

The method comprises determining whether or not a sample from the mammal contains at least 1 marker (e.g. an elevated level of a CD21L polypeptide, an elevated level of a lymphotoxin beta polypeptide, or an elevated level of a chemoattractant polypeptide, or an elevated level of a chemoattractant condition is severe. The method is useful for diagnosing the severity of an arthritis condition (e.g. rheumatoid arthritis) in a mammal, particularly a human. PCR primers ABV76836-27 were used to amplify a CD21L gene fragment from a synovial tissue sample. The primers were used in the method of the invention
                               PCR primers ABV72171-90 were used to amplify Heartbreaker (Hbr) loci from maize genomic DNA. The Hbr family of miniature inverted repeat transposable elements (MTTES) is useful to demonstrate the method of the invention. The specification describes a method for producing a DNA fingerprint of an individual. The method comprises generating restriction fragments to which an adaptor is ligated, amplifying fragments containing a MITE and resolving the amplified fragments. The presence of a certain amplified fragment is correlated to a phenotype. The method is used to characterize the DNA of an individual, to detect polymorphisms, to correlate presence of an amplified fragment with phenotype and to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Determining the severity of arthritic conditions, e.g. rheumatoid arthritis, in a mammal or human by detecting whether a sample contains elevated levels of marker(s), e.g. CD21L polypeptides or lymphotoxin-beta polypeptides.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a novel inhibitor compound directed against the expressed proteins or the transcription product (mRNA) of a murine gene and/or its human orthologue and useful in the treatment of cancer. The compound of the invention demonstrates cytostatic and antiinflammatory activities and may be useful for the preparation of a therapeutic composition for the treatment of cancer, in particular for the treatment of solid tumours of the lung, colon, breast, prostate, ovary and pancreas, as well as leukaemia and lymphoma. Furthermore, the methods of the invention may be utilised to treat inflammatory disorders, as well as the invention and be accepted the invention may be utilised to treat inflammatory disorders, as well as the current sequence is that of the PCR primer of the invention which was used to amplify human PSK (prostate-derived STE20-like kinase) cDNA.

```
The invention relates to a method of diagnosing non-small cell lung cancer (NSCLC) or a predisposition to developing NSCLC in a subject by determining the expression level of a NSCLC-associated gene in a biological sample derived from the subject, where an increase or decrease of the level compared to a normal control level of the gene indicates that the subject suffers from or is at risk of developing NSCLC. The method is useful in diagnosing NSCLC or a predisposition to developing NSCLC in a subject. The compound, polyneucleotide and the encoded polypeptide and composition are useful in treating or preventing NSCLC. This sequence corresponds to an antisense oligonucleotide of genes that are differentially expressed in NSCLC cells.
                                                                                            ss; cytostatic; gene therapy; vaccine; non-small cell lung cancer; NSCLC; diagnosis; cancer; URLC1; antisense.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Diagnosing, preventing and treating non-small cell lung cancer (NSCLC) comprises determining an expression level of an NSCLC-associated gene in

```
melanoma comprising detecting the presence or absence of one or more polymorphic variations associated with melanoma in a nucleic acid sample from a subject. Preventing melanoma in a subject comprises detecting the presence or absence of neor more polymorphic variations associated with melanoma in a nucleic acid sample from a subject; and administering a melanoma preventative to a subject in need thereof based upon the presence or absence of the one or more polymorphic variations in the nucleic acid sample. The preventative reduces ultraviolet (UV) light exposure to the subject. The methods, nucleic acids, proteins, and compositions are useful for treating melanoma. The present sequence represents a human cyclin-dependent kinase 10, CDK10, proximal SNP probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                apoptosis, cytostatic; antiinflammatory; antiasthmatic; respiratory; antirhemmatic; antiarthritic; gynaecological; cardiant; vasotropic; antipsoriatic; antiulcer; gastrointestinal; immunosuppressive; neuroprotective; cancer; autoimmune; neurodegenerative; inflammatory; asthma; chronic obstructive pulmonary disease; cystic fibrosis; myocardia inchritis; acute respiratory distress syndrome; preclampsia; myocardial ischaemia; reperfusion injury; psoriasis; bronchiolitis; Crohn's disease; ulcerative colitis; inflammatory bowel disease; 88;

```
The invention relates to a novel method for identifying an agent that

modulates the function of an apoptosis-associated polypeptide,

particularly a kinase or GCFR (G-protein-coupled receptor). The method

comprises providing a sample containing an apoptosis-associated

polypeptide and a candidate agent and incubating under conditions to

polypeptide and a candidate agent and incubating under conditions to

polypeptide and a candidate agent to the polypeptide, measuring the

binding and comparing it with the binding of the polypeptide to a control

agent known not to bind to the polypeptide. The method of the invention

captured to antiathifammactory, antiasthmatic, respiratory,

antipsoriatic, antiulcer, gastrointestinal, immunosuppressive and

antipsoriatic, antiulcer, gastrointestinal, immunosuppressive and

cantipsoriatic, antiulcer, gastrointestinal, immunosuppressive and

carcar of the kidney, uterus, prostate, bladder, ovary, colon and breast,

leukaemias, sarcomas and myelomas. Purthermore, autoimmune,

cancer of the kidney, uterus, prostate, bladder, ovary, colon and breast,

leukaemias, asarcomas and myelomas. Purthermore, autoimmune,

cancer of the kidney, uterus, pulmonary disease, cystic fibrosis,

cantum, chronic obstructive pulmonary disease, cystic fibrosis,

rheumatoid arthritis, acute respiratory distress syndrome, preciampsia,

myocardial ischaemia, reperfusion injury, psoriasis,

crement sequence is that of a QPCR (quantitative PCR) primer of the

current sequence or absence of siRNAs (small interfering RNAs).
                                                                                                                                                                                                                                                                                                   Identifying a modulator of apoptogis-associated polypeptide function, useful for treating e.g., cancer, comprises incubating a sample containing an apoptosis-associated polypeptide and a candidate agent to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                               g
                                                                                                                                                                                                                                                                           The invention relates to a novel method for predicting the responsiveness of a subject with a cell proliferative disorder of the breast tissues to a therapy comprising analysing the methylation pattern of a target nucleic acids in proliferating at least one of the target nucleic acids in a biological sample obtained from the subject prior to or during treatment. The method of the invention has cytostatic activity, and may have a use in gene therapy. The set of oligonucleotides comprising at least two of the oligomers are useful for detecting the cytosine methylation state and/or single nucleotide polymorphisms (SNRs) within the sequences. The methods, nucleic acid, oligonucleotide, and kit are useful for the treatment, characterisation, classification and/or differentiation, of breast cell proliferative disorders. The method is also useful for predicting the responsiveness of a subject with a cell proliferative disorder of the breast tissues to a therapy. The present sequence is used

The mouse beta defensin-1 (mbD-1) gene specific forward primer 2 was used with reverse primer 1 (AAV23539) or 2 (AAV23540) in a PCR reaction where mbD-1 cDNA (AAV23528) served as a template. The PCR product was used as a probe to isolate the mbD-1 genomic sequence from a mouse genomic library. The mbD-1 cDNA encodes for the mouse beta defensin-1 (AAW53857) peptide. The mbD-1 peptide was found to be highly salt sensitive and have antimicrobial properties. Expression of mbD-1 and its biological activity renders the mouse as at useful model to investigate the role of antimicrobial peptides in pulmonary microbial infections and in respiratory diseases
                                                                                                                                                           products

The invention relates to a mammalian PG1 gene and protein, and a set of PG1 biallelic markers. The PG1 polymucleotide and biallelic markers are used in a hybridisation assay, a sequencing assay, or in an allelespecific amplification assay for determining the identity of a nucleotide at a PG1-related biallelic marker. The methods can be used to detect and to assess the risk of developing cancer or prostate cancer. Early-stage diagnosis of prostate cancer relies on prostate specific antigen (PSA) inability to discriminate between malignant and non-malignant affections of the organ. A need exists for both a reliable diagnostic procedure which would enable early-stage diagnosis, and for preventative and curative treatments of the disease. The PG1 gene can be used for detection of prostate cancer, and the risk of developing it in the future, and can also be used to determine therapies for the disease

designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CDK1, PCNA and Cyclin B1.

Representative examples of ribozyme recognition sites are given in AAA83415 to AAA86787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient in restenosis treatment

The present invention relates to a hairpin or hammerhead ribozyme,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ77440 represent amplification nucleotide sequences. AAZ69579 to AAZ77440 represent amplification have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other treatment.

AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ7440 represent amplification or primers for the biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the identification of the argets on and side effects from the pharmaceutical agents acting on a disease as well as other treatment. The SEQ ID NOS 2852, 2913, 2974, 3035, 3096, 3157, 3227, 3297 and 3367, are not actually given a sequence in the Sequence Listing from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel biallelic markers used to construct a high density disequilibrium
                                                                                                                                                                                                                                                                                                                                                               Human biallelic marker downstream amplification primer SEQ ID NO:11326.

                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to DNA polymerase III holoenzyme subunits and accessory proteins and their coding sequences from Thermus in the various subunits may be useful in PCR assays and for synthesising DNA, since the subunits provide a thermophilic replicate capable of rapid replication and highly processive properties at elevated processive properties on the prior art that is limited by relatively non-processive repair-like DNA polymerases. The present sequence is a PCR primer, which was used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 용
                                                                                                                                                                                                                                            The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme (1) which cleaves RNA encoding a cytokine involved in inflammation, matrix metaloproteinase (MMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid segment encoding (1). (1) can have antipsoriatic, ophthalmological, cytostatic, antiseborrheic, antidiabetic, antisickling, captualmological, vulnerary, keratolytic and virucide activities, and cleaves RNA encoding cytokine involved in inflammation. (1) can be used in gene therapy. (1) and (II) are useful for treating proliferative skin diseases such as psoriasis, atopic dermaticis, actinic keratosis, acquamquus or basal cell carcinoma and viral or seborrheic wart. They can also be used for treating proliferative eye diseases such as diabetic retinopathy, virreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detachment, and for treating and preventing scarring such as keloid, adhesion and hypertrophic or hypertrophic burn carries. AMHSTOST to AAHSTOSD represent sequences used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                       Treating proliferative skin or eye diseases and scarring, using ribozymes that cleave RNA encoding cytokines involved in inflammation, matrix metalloproteinases, growth factors and cell-cycle dependent kinases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    chromosome 1p36-35; chromosome 21q22.1; genetic analysis; genome;

The present invention describes a method of arraying genome clones. The method comprises: (a) clones of the genomic libraries contained in activated comprises: (a) clones of the genomic libraries contained in activated in each of the multiwell plates; (b) a primer designed based on the chromosome marker complished to the mixture to carry out an amplification reaction; (c) a signal corresponding to the marker is detected from the resultant camplified product to specify the discrimination Nos. of the multiwell plates containing the clones having said marker sequence; (d) the order of the maximum in the specified discrimination Nos. of the multiwell completes; (e) the clones in the multiwell plates of the specified discrimination Nos. to array the multiwell confercing discrimination Nos. are mixed respectively in each wells of longitudinal and lateral directions; (f) the mixed clones are cultured and the camplified products; (h) the clones in the multiwell plates are specified from the amplified by using the above primer; (g) signals care detected from the amplified products; (h) the clones are the multiwell plates are specified from the amplified by using the above primer; (g) signals care detected from the amplified by using the above primer; (g) reconstituted as the positions on the chromosome and arrayed. The mixroarray is useful for gene analysis; ABHASSSST to ABHASSSST capresent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

                                                                                                                                                                                                                                                                                                      셤
                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                            The invention relates to a novel double-stranded short interfering nucleic acid (siNA) that downregulates expression of the breakpoint cluster region-v-abl Abelson murine leukaemia viral oncogene homologue 1 (BCR-ABL) gene. The siNNA of the invention demonstrates cytostatic activity and may be useful for modulating expression of the BCR-ABL gene, as well as for treating leukaemia or lymphoma and in diagnosis, drug screening, target identification and validation, genetic engineering, gene function studies and gene mapping. The current sequence is that of the human ERGZ (v-ets erythroblastosis virus EZE oncogene like (avian))-targeted siRNA of the invention.
                                                                                                 double-stranded interfering nucleic acid, useful e.g. for treatment diagnosis of leukemia and lymphoma, downregulates the breakpoint
                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  short interfering nucleic acid; siNA; breakpoint cluster region; v-abl Abelson murine leukaemia viral oncogene homologue 1; BCR-ABL; cytostatic; leukaemia; lymphoma; human; ss; siRNA; ERG2; v-ets erythroblastosis virus E26 oncogene like (avian).

                                                                                                                                                                                                                    The invention relates to a novel double-stranded short interfering nucleic acid (siNA) that downregulates expression of the breakpoint cluster region-v-abl Abelson murine leukaemia viral oncogene homologue 1 (BRC-ABL) gene. The siRNA of the invention demonstrates cytostatic activity and may be useful for modulating expression of the BCR-ABL gene, as well as for treating leukaemia or lymphoma and in diagnosis, drug screening, target identification and validation, genetic engineering, gene function studies and gene mapping. The current sequence is that of the human ERC2 (v-ets erythroblascosis virus E26 oncogene like (avian))-targeted siRNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention describes novel small interfering RNA (siRNA) polymetide polymetide capable of interfering with expression of a polymetide
                                               double-stranded interfering nucleic acid, useful e.g. for treatment diagnosis of leukemia and lymphoma, downregulates the breakpoint
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       88.

having protein-tyrosine-phosphatase (PTP) activity. The products of the invention have cytostatic, immunomodulator, antimicrobial, antiinflammatory, antidabetic and anorectic activity. The methods and compositions of the present invention are useful for treating diseases or conditions associated with aberrant expression or activity of the protein tyrosine phosphatase, such as cancer, autofimmune diseases, infection, inflammation, diabetes and obesity. This sequence represents a siRNA directed against dual specificity phosphatase (DSP) expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention describes novel small interfering RNA (siRNA) polynucleotides capable of interfering with expression of a polypeptide by a waying protein-tyrosine-phosphatese (PTP) activity. The products of the invention have cytostatic, immunomodulator, antimityr. The methods and thinflammatory, antidiabetic and anorectic activity. The methods and compositions of the present invention are useful for treating diseases or compositions associated with aberrant expression or activity of the protein tyrosine phosphatase, such aberrant expression activity of the protein tyrosine phosphatase, such as cancer, autoimmune diseases, infection, inflammation, diabetes and obesity. This sequence represents a siRNA directed against dual specificity phosphatase (DSP) expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New isolated small interfering RNA (siRNA) polynucleotide useful for treating diseases with aberrant activity of the protein tyrosine phosphatase, such as cancer, autoimmune disease, infection, inflammation, diabetes and obssity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 small interfering RNA; siRNA; protein-tyrosine-phosphatase; PTP;

The present invention relates to an analytical chip for simultaneous determination of one or more different bacterial 16S-rRNA in liquid determination of one or more bacterial 16S-rRNA, cample. The chip is useful for detecting one or more bacterial 16S-rRNA, derived from bacteria such as Achromobacter xylosoxidans, Acinetobacter chip such as Achromobacter xylosoxidans, Acinetobacter chip such adiobacter, Bacillus sp., Bacteroridas covatus, Campylobacter fetus, Citrobacter freundii, Enterococcus avium covatus, Campylobacter fetus, Citrobacter freundii, Enterococcus avium covatus, Campylobacter fetus, Citrobacter freundii, Enterococcus avium covatus, Catecophilus acidophilus, Legionella morbillorum, Gardnerella oxytoca catearrhalis, Wacobacterium avium, Neisseria cinerea, Nocardia sp., Cohrobactrum anthropi, Pasteurella multocida, Peptostreptococcus magnus corrobactrum anthropi, Sasteurella multocida, Peptostreptococcus magnus controbactrum anthropi, Sasteurella multocida, Peptostreptococcus magnus controbactrum anthropi, Pasteurella multocida, Peptostreptococcus magnus corrobactrum anthropi, Pasteurella multocida, Peptostreptococcus magnus controbactrum anthropi, Pasteurella multocida, Peptostreptococcus magnus controbactrum anthropi, Pasteurella multocida, Peptostreptococcus magnus controbactrum anthropi, Pasteurella sonnei, Veillonella parvula, Veillonella con sp. or Versinia enterocolitica. The chip is useful for detecting clinically relevant bacterial 16S-rRNA in a liquid sample, simultaneously and embles rapid, accurate, easy and reliable identification of bacteria by cannol a provided sample and also enables chemiliated cost, cannol which is produced at reduced cost, enables determination of 185-rRNA variation of a bacterium even in a complex biological sample. The chip variation of a bacterium even in a complex biological sample.
                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     sequence represents a probe of the invention used as an analytical chip.
                                                                                                                                                                                                                                                                                                                                                                                                                                     analytical chip; bacterial 16S-rRNA; genotypic characterization; probe;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                in a sample with reduced experimental error and variation. The present

The present invention relates to an analytical chip for simultaneous determination of one or more different bacterial 16S-rRNA in liquid determination of one or more different bacterial 16S-rRNA, early of the backerial such as Achromobacter xylosoxidans, Acromobacter baumannii, Actinomyces israelii, Aerococcus viridans, Aeromonas by Bacterial such as Achromobacter yalosoxidans, Bacherococcus viridans, Bacteridas of Covatus, Campylobacter fecus, Cirobacter Manna lentum, Gemella morbillorum, Gardnerella vaginalis, Cirobacterium nucleatum, Gemella morbillorum, Gardnerella vaginalis, Cirobacterium anticuenta, Hafnia alvei, Kingella sy. Klebsiella oxytoca catarrhalis, Mycobacterium avium, Neisseria cinerea, Nocardia sp., Corbrobactrum anticropi, Pasteurella multocida, Peptostreptococcus magnus ochrobactrum anticropi, Pasteurella sonnel, Veillonella parvula, Veillonella sp. or Yersinia enterocolitica. The chip enables determination of one or cinically relevant bacteria. The chip enables determination of bacteria by genotypic characterization in a provided sample and also enables chemitication of a bacterium even in a complex biological sample. The chip which is produced at reduced cost, enables determination of 165-rRNA in a sample with reduced experimental error and variation. The present in a sample with reduced experimental error and variation. The present corporation in a provide as an analytical chip.

Interference RNA agent useful for treating dyslipidemias, coronary artery disease, diabetes, cancer or neurological disease, comprises sense sequence and antisense sequence which has specific modifications.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              sense sequence and an antisense sequence, where the sense sequences have one or more asymmetrical 2-0 alkyl modifications, the antisense sequences have sequences have one or more asymmetrical phosphorothioatte modifications and the antisense sequence targets a human gene sequence. Also described are: a pharmaceutical preparation comprising (1); reducing (M1) apoB-100 levels or glucose-6-phosphatase levels in a subject, producing (1); retablising (1), involves selecting a sequence with activity and introducing one or more asymmetrical modification in the sequence, where the modification decreases nuclease sensitivity while not decreasing its

activity; a kit comprising (I) and instruction for its use; and a device that can be dispense or administer a composition comprising (I). (I) is useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (MI) is useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (MI) is useful for reducing apoB-100 levels or glucose-6-phosphatase levels. The subject is suffering from a disorder characterised by elevated or cherwise unwanted expression of apol-100, elevated or otherwise unwanted levels of cholesterol, and/or disregulation of lipid metabolism. The disorder is chosen from the HDL/LDL cholesterol imbalance, disorder is chosen from the HDL/LDL cholesterol imbalance, bypercholesterolaemia, coronary artery disease (CAD), coronary heart disease (CHD) and atherosclerosis. (I) is administered to a subject to inhibit hepatic glucose production or for treating glucose-metabolism-related disorder e.g. diabetes or type-2 diabetes. (I) is useful for treating the diseases as mentioned above, cancer (e.g. breast, colon or lung cancer), neurological disease (e.g., Huntington disease or spinocerebellar ataxia) or viral disease (e.g., AlDS). This sequence represents a human apolipoprotein B (ApoB) antisense oligonucleotide that

sequence and an antisense sequence, where the sense sequences have one or more asymmetrical 2'-0 alkyl modifications, the antisense sequence and an antisense sequence, where the sense sequences have one or more asymmetrical phosphorothicate modifications and the antisense sequence targets a human gene sequence. Also described are: a pharmaceutical preparation comprising (1); reducing (M1) apoB-100 levels or glucose-6-phosphatase levels in a subject; producing (I); stronging one or more asymmetrical modification in the sequence, where introducing one or more asymmetrical modification in the sequence, where the modification decreases nuclease sensitivity while not decreasing its activity; a kit comprising (I) and instruction for its use; and a device that can be dispense or administer a composition comprising (I). (I) is useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (M1) consider the subject is suffering from a disorder characterised by elevated or otherwise unwanted expression of apoB-100, elevated or otherwise unwanted expression of apoB-100, elevated or otherwise unwanted concert is chosen from the HDL/LDL cholesterol imbalance, dyslipidaemias, hypercholestorolaemia, staffair-resistent conditions and attended concert is chosen from the HDL/LDL cholesterol imbalance, dyslipidaemias, hypercholestorolaemia, staffair-resistent conditions and anticoned above, cancer (e.g. breast, colon or inhibit hepatic glucose production or for treating glucose-metabolism.

The subject is disbetes or type-2 diabetes. (I) is useful for related disorder e.g. diabetes or type-2 diabetes. (I) is useful for related disorder e.g. diabetes or type-2 diabetes. (I) is useful for relating the diseases as mentioned above, cancer (e.g. breast, colon or lung cancer), neurological disease (e.g., AIDS). This sequence of processents a human apolipoprotein B (ApoB) antisace oligonucleotide that ö Interference RNA agent useful for treating dyslipidemias, coronary artery disease, diabetes, cancer or neurological disease, comprises sense sequence and antisense sequence which has specific modifications. The invention describes a RNA interference (iRNA) agent (I) comprising a Gaps Human herpes virus-6; HHV-6; multiple sclerosis; genetic marker; 38E; internal primer 38E6; diagnosis; ss. ö Query Match 1.2%; Score 13.4; DB 1; Length 19; Best Local Similarity 93.3%; Pred. An oligomer has been produced which is capable of inhibiting expression of a collagen gene. The present sequence represents a specifically claimed oligomer Oligo 158 APS, which binds to the polypurine.

CC claimed oligomer region of the rat alphal(I) collagen gene promoter region. The oligomer may be used to impede pathological fibrosis which is associated with mycertanisty heart diseases, atherosclerosis, restenosis, liver cirrhosis, lung fibrosis, and skin fibrosis found in scleroderma, in hypertrophic scars and in skin fibrosis found in scleroderma, in hypertrophic scars and in skin collowing burn nigury. The oligomer inhibits sayression of a collagen collowing cligomer (TPO) which is targeted to a 30-mer polypurine corresponding to the noncoding strand of the promoter collowing oligomer (TPO) which is targeted to a 30-mer polypurine corresponding to the noncoding strand of the promoter colligonal physiological ph
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Preparation of antisense oligo:nucleotide(s) which lack long runs of consecutive guanosine or inosine - and have specific ratio of residues able to form two or three hydrogen bonds, have greater activity and reduced toxicity, used therapeutically or to modulate growth of cells in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAV48412-84 represent antisense oligonucleotides directed against transforming growth factor beta-1 (TGF beta-1). The oligonucleotides exemplify the invention. The specification describes oligonucleotides that contain 8-30 nucleotides, which contain at most 8 nucleotides that can each form three hydrogen bonds to cytosine; do not contain four
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           culture.
```

consecutive cytosines; do not contain two sequences of three consecutive nucleotides each able to form three H-bonds to three consecutive cytosines, and the ratio between residues able to form two H-bonds each (2R) or three such bonds (3R) is given by 2R/3R = 0.33-0.72. The oligonucleotides are used to modulate expression of genes, particularly the genes for p53, ExbB-2, junb, TGF-beta 1 or beta 2 to control proliferation of primary cell cultures (e.g. bone marrow stem, liver or kidney cells, osteoclasts, osteoblasts and/or keratinocytes). The oligonucleotides can also be used to analyye function of proteins (by altering their expression or activity) and therapeutically, e.g. in cases of cancer or (targeting TGP) for stimulating the immune system The present invention describes Wnt-1 induced secreted polypeptides, WISP-1, 2 and 3. The novel WISP polypeptides, designated WISP-1, WISP-2 and WISP-3 have homology to connective tissue growth factor (CTGR). Products from the present invention can be used to treat WISP-related disorders such as breast, ovarian, and colon cancer or melanoma. The products can be used to treat arteriosclerosis. The products can also be used to treat other diseases e.g. benign and malignant tumours, leukaemia and lymphoid WNT-1 induced secreted protein; WISP-1; WISP-3; CTGF; tumour; connective tissue growth factor; cancer; melanoma; arteriosclerosis; leukaemia; lymphoid malignancy; haematopoiesis-related disorder; tissue-growth disorder; skin disorder; desmoplasia; fibrotic lesion; kidney disorder; bone-related disorder; osteoporosis; trauma; burn; connective tissue disorder; catabolic state; inflammation; testicular-related disorder; anglogenesis; immunological disorder; ss. Gaps consecutive nucleotides able to form three H-bonds each to four ö Gurney AL, Hillan K, Lawrence DA; toy MA, Goddard A, Wood WI; New isolated Wnt-1 induced secreted polypeptides, WISP-1, 2 1.2%; Score 13.2; DB 1; Length 18; ilarity 83.3%; Pred.        plandular, macrophagal, epithelial, stronal, and blastocoelic disorders, haematopoiesis-related disorders, tissue-growth disorders, skin disorders, desmoplasia, fibrotic lesions, kidney disorders, skin disorders such as osteoporosis, transma such as burns, incisions, and other wounds, connective tissue disorders, catabolic states, testicular related disorders, and inflammatory, angiogenic and immunologic disorders including arteriosclerosis. The products can also be used for detection and diagnosis especially of individuals with neoplastic cell growth or proliferation. The products can be used in the production of transgenic or knock-out animals. Antibodies can be used to induce death in WISP-1, 2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention provides antisense compounds of 8-30 nucleotides that inhibit the expression of human Cellular Inhibitor of Apoptosis-1 (c-IAP-1). The antisense compounds may be used for diagnostics, therapeutics (for modulating the expression of c-IAP-1), prophylaxis (e.g. to prevent or delay infection, inflammation, or tumor formation), as research reagents (e.g. to distinguish between members of a biological pathway) and in kits. Sequences AAZ22150-189 represent phosphorothioate oligonucleotides used for antisense inhibition of cellular inhibitor of

The invention relates to a modified tRNA primer for reverse transcription of a Murine Leukaemia virus (MLV) retroviral transfer vector. The vector comprises (i) a retrovirus in which at least part of the genomic RNA sequences carrying information for the production of viral proteins have been replaced by one or more sequences carrying information to be the replaced by one or more sequences carrying information to be the replaced in a target cell chromosome, (ii) a primer binding site (PBS) which has been modified to a sequence that does not allow strong base consisting with the 3' end of any naturally occurring tRNA, and the three 5' nucleotides of the PBS are UGG, where the modified tRNA primer has been modified to allow strong base pairing with the PBS of the transfer vector. The retroviral vectors can used as antiviral agents. Such vectors can be directed against pathogenic viruses, e.g. HIV-1, or HIV-1, related to the type used for construction of the vector, thus having the same to the type used for construction of the vector, thus having the same construction of none place virus, or of virus spread. Only specialised packaging cells provided with appropriate artificial primers allow vector propagation. Sequences AAX2147-167 cepticalised with appropriate artificial primers allow vector propagation. Sequences AAX2147-167 cepticalised with appropriate artificial primers allow vector propagations of complex entry modified and cellation of complex entry modified and cellation of complex entry modified and cellation primers allow vector propagation. Sequences AAX2147-167

```
transfer vector in which the genomic RNA sequences encoding viral proteins required in trans for MLV replication have been at least partly replaced by at least 1 sequence carrying information to be introduced into a target cell chromosome, where the primer binding site (PBS) has been modified to a sequence that does not allow strong base-pairing with the 3' end of any naturally occurring tRNA. The transfer vector can be used for gene therapy, e.g. for carrying antisense or ribozyme constructs targeted to the PBS of a pathogenic virus such as HIV or HTLV-I. The modified PBs reduces the risk of uncontrolled regeneration of whole virus by interaction of the vector with various engineered or endogenous cistor trans-acting components
                                                                                                                                                                                                           LRNA, transfer vector, viral protein; replication; primer binding site;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     셤
                                                                                                                                                                                                                                                                                                                                                                                          This invention relates to a new tRNA primer for reverse transcribing a retroviral transfer vector comprising a primer binding site (PBS) that has been modified to a sequence that does not allow strong base pairing with the 3' end of any naturally occurring tRNA and comprises three 5' pairing with the modified PBS of a transfer vector; reverse transcribes the retroviral transfer vector which comprises a retrovirus in which at least part of the genomic RNA sequences necessary for production of viral proteins required in for retroviral replication have been replaced by sequences to be introduced in a target call chromosome; and has a PBS that has been modified to a sequence that does not allow strong base that has been modified to a sequence that does not allow strong base pairing with the 3' end of any naturally occurring tRNA and the three 5' nucleotides are UGG. The primer is used for reverse transcribing the retroviral vector comprising a retrovirus with infectivity for birds and channels in which a part of the genomic RNA sequences necessary for production of viral proteins required in trans for retroviral replication of viral proteins required in trans for retroviral replication.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ô
                                                                                                                                                                                                                                                                                                                       New modified tRNA primer for reverse transcribing a retroviral transfer vector comprising a primer binding site modified to a sequence which does not allow strong base pairing with the 3' end in any occurring tRNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          to be introduced in a target cell represents a murine tRNA sequence used

A method has been developed for detecting the presence or absence of a single nuclectide polymorphism (SNP) allele in a genomic Sample. The method comprises preparing a reduced complexity genome (RCG) from the genomic sample and analysing the RCG for the presence or absence of a SNP allele. The method can be used to characterise a tumour, to generate a genomic pattern for an individual genome or. to generate a genomic classification code for a genome. The method can be used to assess whether a subject is at risk for developing a disease or to identify a set of SNP alleles associated with a disease. The method can also be used to perform linkage analysis. AAA35941 represent sequences used in the exemplification of the present invention. AAA35948 to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Collagen; inhibit; myocardial fibrosis; hypertensive heart disease; atherosclerosis; restenosis; liver cirrhosis; lung fibrosis; burn injury; peritoneal fibrosis; skin fibrosis; scleroderma; hypertrophic scar; ss.

                                                                                                                                                This sequence represents an oligomer which is capable of inhibiting the expression of the collagen gene. The oligomer is capable of binding to proteins, and is the major element of skin, bone, tendon, cartilage, blood vessels and teeth. The oligomers are useful for inhibiting a cell and causing an intracellular reaction to inhibit the gene expression of the collagen gene, comprising inserting the oligomers into a cell and causing an intracellular reaction to inhibit the gene expression. The collagen inhibitory oligomers of the invention are useful for treating pathological fibrosis associated with myocardial fibrosis in hypertensive heart disease, atheroscalensis, restenosis, liver cirrhosis, lung fibrosis, peritoneal fibrosis and skin fibrosis found in scleroderma, hypertrophic scars and burn injury
                                                                                        Inhibitors of collagen gene useful for treating fibrosis associated with atherosclerosis, restenosis, liver cirrhosis, lung and skin fibrosis, comprises oligomers capable of inhibiting collagen gene.

The invention relates to a novel method of detecting a target nucleic acid molecule. The method involves contacting a sample with a locator probe comprising a binding moiety specific for the target molecule and an amplification nucleic acid sequence. An amplification structure which is bound to the target molecule-locator probe complex is produced via amplification template (comprising, in the 5 to 3' direction, an extension nucleic asmple and locator probe using a single stranded amplification template (comprising, in the 5 to 3' direction, an extension nucleic acid sequence, a hybridisation nucleic acid sequence of capable of removing sufficient of the extension nucleic acid sequence of the amplification template when hybridised to the complementary strand to the amplification template to the complementary strand to of the amplification template to the complementary strand; After optionally repeating amplification of this structure, any additional correlated with the presence of a target molecules. The method is used to correlated with the presence of a target molecules. The method is used to amplification of the target acid detected, and the result of detect target molecules in a sample by using an enzymatically catalysed amplification of the target account of the amplification template and detectable structures. As a small ample to the amplification of the target acid sequence of a target detectable structures. As a small
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 amplification rather than target amplification, thus overcoming contamination problems. It is an enzymatically catalysed process that actively assembles the signal generating structure rather than relying on the passive hybridisation-based methods of non-enzymatic methods such as bDNA. Unlike prior art techniques such as polymerase chain reaction (PCR), the method has the ability to address RNA and DNA targets with equal efficiency without pretreatments. The present sequence represents detection oligonucleotide, SA-BL, used with amplification template SA-EXI (AAA97373) in an exemplification of the invention to detect the CMV GlyB
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                number of inexpensive components are utilised, the new method is more economical than previous methods. The method utilises signal amplification rather than terrat components.
Detecting a target molecule by enzymatically catalyzed amplification of target associated detectable structures comprises contacting a sample with a locator probe, amplifying the structure bound and detecting bound
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           target oligonucleotide CMV-002 (AAA97372)
                                                                                                                                                                                                                                                                                                                                       Example 5; Page 72; 75pp; English

                                                                                                                                                                                                                         The present invention describes a retroviral vector (I) comprising a retrovirus in which at least part of the genomic RNA sequences carrying information for the production of viral proteins required in trans for retroviral replication have been replaced by one or more sequences carrying information to be introduced in a target cell chromosome, where the primer binding site (PBS) has been modified to a sequence that does not allow strong base pairing with the 3'-end of any naturally occurring tRNA, and where the three 5'-nucleotides of the PBS are UGG. (I) are potentially useful as antiviral agents, e.g. against human immunodeficiency virus or human 1'-cell lymphotropic virus-1. (I) depends on a specifically engineered tRNA-like primer for reverse transcription, so only special packaging cells, containing an artificial primer, can support vector propagation. This reduces the risk of uncontrolled regeneration of complete virus if (I) interacts with engineered or endogenous cis- or trans-acting components, particularly transfection efficiency is reduced by a factor of 100000 in normal packaging cells. (I) can be derived from pathogenic viruses of the same type as used for vector construction, i.e. they have the same host range and cell tropism, but the modified PBS means that antiviral activity would not be directed against the vector's own cis-acting elements. The present sequence is murine tRNA sequence, which is used in the exemplification of the present and the present in the exemplification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

AAZ69579 to AAZ7740 represent amplification brimers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the pharmaceutical efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other treatment.

Nucleic acid molecule down-regulated during tumor progression and/or metastasis as prognostic markers in diagnosis of metastatic and progression potential of tumor cells, and for treating cancer.

Disclosure; Page 17; 48pp; English

The present invention relates to a novel human integral seven

ö transmembrane protein with a long N-terminal extracellular domain: TMYXNI (see AAA91751 and AAB31700). Based on homology comparison, TMYXNI can be placed in the secretin family of G-protein-coupled peptide hormone receptors. TMYXNI gene expression is down-regulated in metastatic human melanoma cells, and is down-regulated during tumour progression and/or metastasis. Therefore, TMYXNI may be involved in metastasis due to its down-regulation in melanoma cells. The TMYXNI gene is localised on chromosome 16q13, and is therefore a candidate gene for the tumour supressor gene cyldl, which is involved in cylindromatosis. The present sequence is a PCR primer for the coding sequence of TMYXNI. This sequence was used during the study of mRNA expression of TMYXNI in various human New polynucleotide encoding prolactin regulatory element binding protein useful for treating osteoporosis, cancer and autoimmune diseases. The specification describes a prolactin regulatory element binding (PREB) protein. The protein is a kinase-mediated hormonal regulator of prolactin gene expression, i.e. a transcription factor. The protein binds to the 1P element pf the prolactin pronoter. PREB proteins are useful for treating osteoporosis. PREB modulators are useful for treating cancer, autoimmune sequences by inhibiting the expression of prolactin. PREB antisens of prolactin gene expression is useful for treating a development defect. Inhibition of prolactin gene expression is useful for inhibiting graft.versus-host flaseases in transplantations. PREB polymucleotides are useful as a probe for diagnosing trisomy 2p in a subject. PCR primers AAA75984-87 were useful to amplify a human PREB gene fragment

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to an oligonucleotide array comprising orligonucleotide tags fixed to a solid substrate. The oligonucleotide array is useful for genotyping a nucleic acid sample at one or more loci via single base extension (SBE) reactions. A pair of primers is used to amplify a polymorphic locus in a sample e.g. a single nucleotide polymorphism (SNP). The present sequence is one of the primers used in the method of the present invention to amplify a polymorphic sample. The amplified nucleic acid product is then used as a template in a SBE reaction with an extension primer. The SBE reaction products are used to
                                                                                                                                                                                                      Oligonucleotide array; genotyping; single base extension reaction; SBE; PCR primer; polymorphic locus; single nucleotide polymorphism; ss.

New antisense oligonucleotides to metabotropic glutamate receptor type 1 gene, which specifically hybridize to mRNA expressed from the gene useful for treating disorders related to elevated glutamate level such as pain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; hyperpolarisation-activated cyclic nucleotide-gated channel; HCN; therapy; stroke; ischaemia; head injury; epilepsy; Alzheimer's disease; parkinson's disease; learning disorder; memory; attention disorder; pain; gut disorder; irritable bowel syndome; IBS; sleep disorder; nootropic; neuroprotective; cerebroprotective; antiinflammatory; anticonvulsant; tranquilliser; vasotropic; reverse transcription; RT; PCR primer; 88.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to an antisense oligonucleotide derived from the sequence of metabotropic glutamate receptor type 1 (mGluKl) gene. The antisense oligonucleotide binds to a portion of mRNA expressed from the gene or its splice variant. The binding of the oligonucleotide host cell expressing the gene. The oligonucleotides are useful for treating chronic pain caused by injury or inflammation of a nerve caused by arthritis. The oligonucleotides may be used with an opioid analgesic. They are also useful for minimizing glutamate enurotoxicity and/or excitotoxicity associated with stroke, isohemia, CNS trauma, neurodegenerative disorders, gastrointestinal disorders or to inhibit
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

                                                                                                                                                                                                                                                                                                                                                            g
                                                                                                                                                                                                                                                                      8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ô
                                                                                                                                                                                                                                                                             The invention relates to new uses of human hyperpolarisation-activated, cyclic nucleotide-gated (HCN) channel polypeptides and their polymucleotides. The HCM channel polypeptides and polymucleotides can be polymucleotides. The HCM channel polypeptides and polymucleotides can be used in the manufacture of medicaments to treat stroke, ischaemia, head injury, epilepsy, Alzheimer's disease, Parkinson's disease, learning or memory and attention disorders. These compounds may also be used in treating pain, gut disorders, in particular Irritable bowel syndrome (IBS) or sleep disorders. HCM polymucleotides and polypeptides may also be employed as diagnostic reagents for detection of mutations in the above stated diseases. The present sequence is a reverse transcription (RT)-PCR primer used to amplify human HCN1 channel DNA and it is used in the tissue localisation of HCN1 mRNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; glial cell derived neurotrophic factor; GDNF; PCR; primer; 88;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human glial cell derived neurotrophic factor (GDNF) PCR primer #30.
                                                                                                                                                                                                    New HCN channel polypeptides and polynucleotides which encode the polypeptides, for the manufacture of compositions to treat stroke, ischemia, head injury, epilepsy, Alzheimer's disease, Parkinson's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

The invention relates to the human glial cell derived neurotrophic factor (GDNF) and its derivatives and use. The invention also relates to a method of obtaining DNA encoding human glial cell derived neurotrophic factor or its active segments and a method of purifying and fining coarse GDNF. A composition comprising human glial cell derived neurotrophic factor and a medicinal acceptable carrier can be used in the treatment of nervous system diseases. Sequences ACA96807-ACA96859 represent PCR primers used to amplify human GDNF CDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Haematopoietic cell proliferation disorder related oligonucleotide #1132.
                                                                                               Human glial cell derived neurotrophic factor and its derivatives and use.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Pelet C;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Detecting and differentiating between hematopoietic cell proliferative disorders, comprises contacting a target nucleic acid with a reagent the distinguishes between methylated and non-methylated CpG dinucleotides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes a method for detecting and differentiating between haematopoietic cell proliferative disorders associated with at least 1 gene and/or their regulatory regions in a subject. The method comprises contacting a target nucleic acid in a

```
biological sample obtained from the subject with at least 1 reagent, which distinguishes between methylated and non-methylated CpG dinucleotides within the target nucleic acid. AB209861 to AB211118 represent specifically claimed nucleotide sequences from the present invention. Oligonucleotides from the present invention can be used: for differentiating between healthy haematopoietic cells and proliferative disorder haematopoietic cells, for differentiating between acute lymphocytic leukaemia and acute myelogenous leukaemia; as probes for determining the cytosine methylation state and/or single nucleotide polymorphisms (SNPs) of haematopoietic cell proliferation disorder related sequences and their complements; and as primers for the maplification of haematopoietic cell proliferation disorder related DNA sequences. The nucleotide sequences from the present invention can also be used for detecting a predisposition to, differentiation between the languages, diagnosis, presement and/or monitoring of haematopoietic cell proliferative disorders. The present method enables a highly specific classification of haematopoietic cell proliferative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Detecting and differentiating between hematopoietic cell proliferative disorders, comprises contacting a target nucleic acid with a reagent that distinguishes between methylated and non-methylated CpG dinucleotides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Haematopoietic cell proliferation disorder related oligonucleotide #1131.

subject. The method comprises contacting a target nucleic acid in a biological sample obtained from the subject with at least 1 reagent, which distinguishes between methylated and non-methylated CpG dinucleotides within the target nucleic acid. AB209861 to AB21118 represent specifically claimed nucleotide sequences from the present invention. Oligonucleotides from the present invention calls for differentiating between acute invention. Oligonucleotic cells, for differentiating between acute lymphocytic leukaemia and acute myelogenous leukaemia; as probes for determining the Cycosine methylation state and/or single nucleotide polymorphisms (SNPs) of haematopoietic cell proliferation disorder related sequences and their complements; and as primers for the application of haematopoietic cell proliferation between sequences. The nucleotide sequences from the present invention can also be used for detecting a predisposition to, differentiation between subclasses, diagnosis, prognosis, treatment and/or monitoring of haematopoietic cell proliferation of patients
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               vaccine, attenuated virus; recombinant virus; cancer; neoplasm; tumour; replication-competent virus; carcinoma; viral infection; HIV; rotavirus; respiratory syncytial virus (RSV); Hepatitis A virus; politovirus; prapilloma virus; measles virus; influenza virus; bacterial disease; PCR; Vibrio cholerae; enterotoxigenic Escherichia coli; Shigella; Listeria; Streptococcus; Salmonella; parasite; Plasmodium falciparum; trypanosome;

```

The invention relates to a population of live attenuated recombinant replication-competent viruses, which comprise at least two member viruses. Bach of the member viruses comprises a nucleotide sequence encoding a different antiganic polypeptide from a pathogenic organism other than a parent virus from which the recombinant virus was derived, and which is capable of being expressed in a eukaryotic cell. The replication-competent virus population is useful in a method of inducing an immune response in a subject. This comprises administering a first population of replication-competent viruses; and after a time, administering a second population in a second strain of the replication-competent viruses. The second strain is a different strain from the first strain. The population of ilve attenuated recombinant replication-competent viruses is useful as a varying a varying an immune rearrier is a subject of a subject of a varying an immune reasons. a vaccine, particularly for eliciting an immune response in a subject. In particular, the population of live attenuated recombinant replication-competent viruses is useful for treating or inhibiting cancer, neoplasm, tumour or carcinoma. Also for preventing, reducing, treating, inhibiting viral infection such as HIV, rotavirus, respiratory syncytial virus (RSV), Hepatitis A virus, poliovirus, papilloma virus, measles virus and influenza virus; bacterial diseases caused by e.g. Vibrio cholerae, enterotoxigenic Escherichia coli, see plasmodium falciparum, trypanosomes. The present sequence represents the DNA fragment B amplification primer Bl Novel mutant DNA sequence encoding peroxisome proliferator-activated receptor coactivator useful for identifying subjects who are at increased risk of developing type 2 diabetes. The invention relates to an isolated polynucleotide molecule comprising nucleotide sequence encoding peroxisome proliferator-activated receptor-Peroxisome proliferator-activated receptor-gamma coactivator-1; PGC-1; type 2 diabetes; antidiabetic; enzyme; PCR; primer; ss. cc diabetes of at least one nucleotide, or comprising a fragment of the uncleotide sequence including the mutation. The isolated polynucleotide is useful for detecting the presence of a mutation in the gene encoding CC is useful for detecting the presence of a mutation in the gene encoding PGC-1, by obtaining a biological sample from a subject and analyaing the sample for a mutation associated with type 2 diabetes of the nucleotides in PGC-1, by obtaining a biological sample is obtained from a subject, DNA is isolated polynucleotide which contains a mutation associated with type 2 diabetes of at least one nucleotide or comprising a fragment of the concleotide sequence including the mutation to be detected, and hybridisation of the labelled polynucleotide to the DNA is determined. The amplified DNA is hybridised to a second labelled polynucleotide comprising a DNA sequence corresponding to a part of the wild-type gene corresponding polynucleotide carrying the mutation is labelled polynucleotide to the amplified DNA is determined. The substance with which the second labelled polynucleotide carrying the mutation is labelled in the labelled corresponding to a part of the wild-type DNA is labelled. This method is corresponding to a part of the wild-type DNA is labelled. This method is corresponding to a part of the wild-type DNA is labelled. This method is useful for determining predisposition to type 2 diabetes and to determining predisposition to type 2 diabetes and to determining predisposition to type 2 diabetes and to determining the polynucleotide sequence anticy at the perceptor-gamma and for tailoring antidiabetic medication. This polynucleotide sequence represents a perimer used for mutational analysis of the peroxisome proliferator-gamma coactivator-I (PGC-1) of the invention ö Amplifying nùcleic acid in animal cells, useful e.g. for gene therapy or vaccination, uses an RNA-dependent, RNA-polymerase of a plant virus. This invention describes a novel method for amplifying nucleic acid in animal cells by introducing an RNA-dependent RNA polymerase (RARP) and it's associated promoters and cis-acting signals from a plant virus into the cells. RARP is normally active in plant cells and the gene that encodes it can be recovered from such cells. Both the RARP and the promoter are from plant viruses, particularly turnip crinkle virus and the amplified RNA is a modified satellite or genomic RNA of this virus. The method is particularly used for amplification of RNA (which may be remany for protein synthesis; an effector, e.g. antisense RNA or ribozyme, cor genomic RNA) in animal cells, for (i) control of gene expression or (ii) for gene therapy or vaccination. When the system includes an inducible promoter, it permits strong and rapid expression or conscious in response to a test substance, especially where the promoter capponds to the human immune deficiency virus or heavy metals, to produce a diagnostic system or biosensor, respectively. The method of the cinvention provides an inducible or constitutive, autonomous RNA-dependent CNA amplification system for animal cells that requires only one convention and does not use any viral structural genes or helper viruses. Amplification takes place in the cytoplasm without using any components octonically infectious for the host cells. Human 23 cells were constituting, iii) plu0-39, expressing a turnip crinkle virus 88 kD protein; iii) plu0-60, expressing a turnip crinkle virus 88 kD concent protein in the antisense orientation, and (iii) an expression concent protein in the antisense orientation, and (iii) an expression concent protein in the antisense orientation, and fill an expression concent protein of the reporter gene was detected by fluorescence promoter. Expression of the reporter gene was detected by fluorescence concent turnip crinkle virus (TCV) RARP gene into plu0-39.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Wnt-1 induced secreted protein; WISP; Wnt-1 induced gene; WIG; WISP-1; WISP-2; WISP-3; connective tissue growth factor; CTGP; tumour cell; cell death; atherosclerosis; malignant disorder; breast cancer; ovarian cancer; colon cancer; melanoma; antiarteriosclerotic; cytostatic;

                                                                                                                                                                                      The present invention relates to the isolation of novel Wnt-1 induced secreted proteins (WISPs, previously known as Wnt-1 induced gene (WIG) polypeptides), and the polymucleotide sequences encoding them. The novel WISP proteins (WISP-1, WISP-3) show homology to connective tissue growth factor (CTGF). Also disclosed are vectors and host cells comprising WISP polypeptides fused to heterologus polypeptides, anthodies which bind WISP polypeptides, and methods for producing the polypeptides. The antibody may be used in a composition to inhibit the growth of tumour cells by inducing death of the cells which are overexpressing the WISP polypeptides. The WISP polypeptides gequences are useful for preparing a composition for treating wisp-realed disorders sequences are useful for preparing and malignant disorders (e.g. breast, ovarian or colon cancer or melanoma) in a mammal. The present sequence represents a PCR primer used
                                                   New nucleic acid encoding Wnt-1-Induced Secreted Protein, useful for preparing a composition for treating a WISP-related disorder in a mammal comprising atherosclerosis or malignant disorder, e.g., breast, ovarian
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Determining predisposition to inverted nipples useful e.g. for selecting breeding animals comprises detecting specific microsatellite markers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to the use of a nucleic acid to determine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gapa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         the predisposition of appearance or inheritance of inverted nipples, where the nucleic acid is identical to the region of microsatellites
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Mammalian inverted nipple associated microsatellite PCR primer #90.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a novel human polymuclectide and the encoded polypeptide. A polymuclectide of the invention May have a use in gene therapy. An oligomuclectide of the invention ADM65202-M006773 is useful detecting the polymuclectide. The polymuclectide or as a probe for useful in gene therapy, for developing a diagnostic marker or medicines for regulating their expression and activity, or as a target of gene therapy. The proteins ADM03759-ADM06201 encoded by the polymuclectides are useful as pharmaccutical agents. The present sequence represents an oligonuclectide used in the invention.
   S0200, SW2443, S0097, S0007, SW1301 or S0164 on chromosomes 6, 2, 4, 14, 1 and 3, respectively, in pigs, or homologous positions in the genomes of other mammals. The nucleic acids can be used to select pets, breeding or farm animals that lack inverted nipples, particularly by genomic screening of many related mammals in a population. The present sequence is a PCR primer used in the exemplification of the invention to identify microsatellite markers associated with the inverted nipple phenotype
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             human; gene therapy; diagnostic marker; pharmaceutical; ss; PCR; primer.

The invention relates to a method of inducing cellular apoptosis

comprising administering to a cell an effective amount of an antisense

compound targeted to a nucleic acid molecule encoding human cellular

inhibited and apoptosis 1 (GIAP-1), so that expression of GIAP-1 is

inhibited and apoptosis is induced. The cell used in the method is a

confort cell. The antisense compound is an antisense oligonucleotide that

comprises at least one modification of the internucleoside linkage, wherein the modification is a phosphorothioate

moiety or nucleobase, wherein the modification is a phosphorothioate

confortsosine nucleobase. The antisense oligonucleotide is a chimeric

coligonucleotide. The methods and compositions are useful for the

prevention and/or treatment of diseases or conditions associated with

coligonucleotides and virial infections. This sequence represents a

cautoimmune disorders and virial infections. This sequence represents a

chuman cIAP-1 DNA antisense oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Inducing cellular apoptosis by administering an antisense modulating the human Cellular Inhibitor of Apoptosis-1, useful in preventing or treating cancer, autoimmune disorders and viral infections.
                                                                                                                                                                                                                                                 cancer; antisense oligonucleotide; phosphorothioate internucleoside linkage; 2'-0-methoxyethyl sugar molety; 5-methylcytosine; autoimmune disorder; viral infection; cytostatic;

                                                                                                                                                                                                                                                                                                            The invention relates to compounds, compositions and methods for modulating the expression of MD-1 RP105-associated (also called as MD-1 and MD1) DNA. The composition comprise antisense oligonucleotides targeted to MD-1 RP105-associated DNA. The compound is useful for preparing a composition for treating autoimmune disorder. It is also useful in gene therapy. The present sequence is a PCR primer used for amplifying human MD-1 RP105-associated DNA. This sequence is used to illustrate the method of the invention.
                                                                                                                                                                                                                                                        New oligonucleotide compound that inhibits expression of MD-1 RP105-associated, useful for preparing a composition for treating autoimmune

The present invention relates to a method for identifying a subject at risk of breast cancer. The method comprising detecting the presence or absence of one or more polymorphic variations associated with breast cancer in a nucleic acid sample from a subject. The nucleic acid sample comprises the DLG1 region (AD079402), KIAA0783 region (AD079403), DPF3 region (AD079404) or CEMPC1 region (AD079405). The gene DLG1 (discs, large homolog 1 (Drosophila)) is also known as synapse-associated protein 97, hdlg or SAP97. DLG1 has been mapped to chromosomal position 7p21.3. The KIAA0783 protein is an overland protein or protein the comprises with unknown function, however, being a zinc finger protein, cancer gene WIAA0783 protein is a novel gene with unknown function, however, being a zinc finger protein, can be been mapped to chromosomal position 14q44.3.q11.1. The cator. DPF3 has been mapped to chromosomal position 14q44.3.q11.1. The cator. DPF3 has been mapped to chromosomal position 4q12-q10.3.3. CENPC1 (centromere protein C1) is also known as Centromere catoantigen and a component of the inner kinetochore plate. The CENPC1 protein is required for maintaining proper kinetochore plate. The CENPC1 protein is required for maintaining proper kinetochore size and a timely translition to anaphase. The method is useful for identifying a subject at risk of breast cancer, to analyze and candidangosis, prevention and treatment of breast cancer, to analyze and predict a response to a breast cancer treatment, and in clinical drug crials. The present sequence was used in an example from the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                   Identifying a subject at risk of breast cancer by detecting the presence of polymorphic variations in the DLG1, KIAA0783, DPF3 or CENPC1 regions which are associated with breast cancer in a nucleic acid sample from a

The present invention relates to murine oligonucleotides (ACC62754-ACC68806), which are associated with tumour suppression, tumour reversion, apoptosis and virus resistance. The oligonucleotides are useful as (1) as probes and primers for detecting, identifying, quantifying and/or amplifying nucleic acid, e.g. as one component of gene chip; in vitro as (anti) sense reagents; and (2) for production of recombinant polypeptides. The oligonucleotides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells.
                                                                                   Cytostatic; virucide; neuroprotective; nootropic; neuroleptic; murine; tumour suppression; tumour reversion; apoptosis; virus resistance; viral disease; tumour; cell degeneration; cancer; Alzheimer's disease; schizophrenia; ss.
                                                    Murine oligonucleotide associated with tumour supression, SEQ ID 4476.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1.1%; Score 12; DB 1; Length 17; 100.0%; Pred.
